Abstract

Inflammatory bowel disease results from chronic dysregulation of the mucosal immune system and aberrant activation of both the innate and adaptive immune responses. IL-19 is a member of the IL-10 family, and IL-10 plays important role in inflammatory bowel disease. We have previously shown that IL-19 knockout mice are more susceptible to innate-mediated colitis. Next, we ask whether IL-19 contributes to T cells-mediated colitis. Here, we investigated the role of IL-19 in a mouse model of Th2 cell-mediated colitis. Inflammatory responses in IL-19-deficient mice were assessed using a Th2-mediated colitis induced by oxazolone. The colitis was evaluated by analyzing body weight loss and histology of the colon. Lymph node cells were cultured *in vitro* to determine cytokine production. IL-19 knockout mice exacerbated oxazolone-induced colitis by stimulating the transport of inflammatory cells into the colon, and by increasing IgE production and the number of circulating eosinophil. The exacerbation of oxazolone-induced colonic inflammation following IL-19 knockout mice was accompanied by increased production of IL-4 and IL-9, but no changes in the expression of IL-5 and IL-13 in lymph node cells. IL-19 plays an anti-inflammatory role in the Th2-mediated colitis model, suggesting that IL-19 may represent potential

1
2 therapeutic target for reducing colonic inflammation.

Introduction

IL-19 was originally found by sequence homology to IL-10 (Gallagher et al., 2000), and is a member of the IL-10 family, which also includes IL-20, IL-22, IL-24, IL-26, IL-28A, IL-28B, and IL-29 (Sabat et al., 2007). Our previous studies showed that IL-19-knockout (KO) mice are more susceptible to experimental acute colitis induced by dextran sulfate sodium (DSS), and this increased susceptibility is correlated with the accumulation of macrophages and the increased production of interferon (IFN)- γ , IL-1 β , IL-6, IL-12, TNF- α , and CXCL1 (Azuma et al., 2010a).

DSS-induced colitis is a well-characterized model of colonic inflammation. The adaptive immune system obviously does not play a major part in DSS-induced colitis model, because T- and B-cell-deficient mice also develop severe colonic inflammation in this model (Dieleman et al., 1994). Clinically, Ulcerative colitis (UC) and Crohn's disease (CD) are two of the most common types of inflammatory bowel diseases (IBDs) and are characterized by dysregulated intestinal inflammation and mucosal tissue damage in parts of the gastrointestinal tract (Tong et al., 2013). CD is characterized by transmural and discontinuous inflammation, which is associated with a type-1 response mainly driven by IL-12 and IFN- γ

1
2 (Monteleone et al., 2005). **In contrast**, UC involves the superficial mucosal
3
4 and submucosal layers of the colon and is driven by type-2 cytokines, such as
5
6
7 IL-4, IL-5, and IL-13 (Tanaka et al., 2010). However, little is known about the
8
9 exact immunological role of IL-19 in the regulation of IBD **such as T-cell**
10
11 **mediated colonic inflammation**.
12
13
14
15

16
17 To determine the potential role of IL-19 in IBD, we previously
18
19 examined the role of IL-19 in the 2,4,6-trinitrobenzene sulfonic acid
20
21 (TNBS)-induced colitis model which shows a clear type-1 phenotype (Kitani
22
23 et al., 2000). We demonstrated that IL-19-KO mice aggravated TNBS-induced
24
25 colitis (Matsuo et al., 2015). Since TNBS-induced colitis resembles the
26
27 symptom seen in CD, the exact immunological role of IL-19 in the regulation
28
29 of UC remains **still** unclear. In this study, we investigated the role of IL-19 in
30
31 oxazolone-induced colitis which is useful for the study of the type-2
32
33 inflammatory response and resembles the symptom seen in UC (Heller et al.,
34
35 2002; Boirivant et al., 1998).

50 **Mice**

51
52 We constructed targeting vectors for the IL-19 gene and used them to generate
53
54
55 IL-19-KO mice. C57BL/6-IL-19 mice were backcrossed onto the Balb/c
56
57
58
59
60
61
62
63
64
65

1
2 genetic background for at least 10 generations. Balb/c-IL-19 heterozygous
3
4
5 mice were intercrossed to generate mutant and control mice. Age-matched
6
7
8 mice (10–15 weeks old) were used in all experiments. All procedures used in
9
10
11 this study complied with institutional policies of the Osaka Prefecture
12
13
14 University Animal Care and Use Committee.
15

16 17 18 19 Oxazolone-induced colitis

20
21
22 To presensitize mice, a 2 × 2 cm field of the abdominal skin was shaved, and
23
24
25 150 µL of a 4% (w/v) solution of oxazolone in 100% ethanol was applied.
26
27
28 Seven days after presensitization, colitis was induced by intrarectal
29
30
31 administration with 100 µL of 3% of oxazolone in 50% ethanol using a plastic
32
33
34 catheter. Control mice were administered a 50% ethanol solution without
35
36
37 oxazolone using the same technique. Body weights were monitored daily.

43 RNA isolation and quantitative real-time reverse transcription polymerase 44 45 46 chain reaction

47
48
49 Total RNA was isolated from the distal colon as previously described (Azuma
50
51
52 et al., [2010b](#)), with minor modifications. RNA was used to synthesize
53
54
55 complementary cDNA using SuperScript Reverse Transcriptase (Roche,
56
57
58 Madison, WI, USA). The primers used for amplification of IL-19 were as
59
60
61
62
63
64
65

1 follows: 5'-ATGAAGACACAGTGCGCGTC-3' and
2
3
4
5 5'-GTGTCAGGCTGCAGGAG-3'. mRNA expression levels were quantified
6
7 using real-time PCR analysis based on the intercalation of SYBR Green
8
9
10 (Toyobo, Osaka, Japan). The amplification of *HPRT* mRNA was used as an
11
12 endogenous control to account for differences in the amount and quality of
13
14 RNA added to each reaction.

22 Histology

23
24
25 The distal colon was fixed with 10% neutral buffered formalin and embedded
26
27 in paraffin. Sections were stained with hematoxylin and eosin (HE). The
28
29 severity of intestinal inflammation was graded using a previously described
30
31 system for colitis from 0 to 4 as follows: 0, no leukocyte infiltration; 1, low
32
33 level of leukocytic infiltration; 2, moderate level of leukocytic infiltration; 3,
34
35 high level of leukocytic infiltration, high vascular density, thickening of the
36
37 colon wall; and 4, transmural infiltration, loss of goblet cells, high vascular
38
39 density, thickening of the colon wall (Fuss et al., 1999). All sections were
40
41 scored in a blinded fashion by a pathologist.

52 Myeloperoxidase (MPO) activity in the colon

1
2 Neutrophil infiltration into the colon was quantified by measurement of MPO
3
4 activity. The distal colon was homogenized in PBS containing Complete
5
6 Lysis-M (Roche). Homogenized samples were placed on a rotary shaker at 300
7
8 rpm on ice for 30 min and centrifuged at $12,000 \times g$ for 10 min. Supernatants
9
10 were then collected, and protein concentrations were quantified and adjusted
11
12 to 0.9 mg/mL. MPO activity was determined using an EnzChek MPO Activity
13
14 Assay Kit (Life Technologies, Palo Alto, CA, USA) according to the
15
16 manufacturer's instructions.

28 Immunofluorescence staining

29
30 The distal colon was fixed with 4% paraformaldehyde. Frozen sections (5 μ m
31
32 thick) were prepared for immunofluorescence staining as previously described
33
34 (Azuma et al., 2008), with minor modifications. Macrophages were detected
35
36 using rat anti-mouse F4/80 monoclonal antibodies conjugated to Alexa Fluor
37
38 647 (CI:A3-1; AbD Serotec). Neutrophils were detected using rat anti-mouse
39
40 Gr-1 monoclonal antibodies conjugated to Alexa Fluor 488 (RB6-8C5; AbD
41
42 Serotec). Confocal images were obtained under a laser-scanning microscope
43
44 (C1si; Nikon Corporation, Tokyo, Japan).

58 IgE ELISA

1 Serum IgE levels were measured by ELISA (Koma Biotech, Seoul, Korea)
2
3
4
5 according to the manufacturer's instructions.
6
7

8 9 10 Differential white blood cell counts

11
12 Blood smears slides were stained with Giemsa (Wako, Osaka, Japan).
13

14
15
16 Differential cell counts were determined for 2000 cells per slide under oil at
17
18
19 60× magnification. During cell counting, the researcher was blinded to the
20
21
22 experimental treatment.
23
24

25 26 27 28 Eosinophil staining

29
30
31 Eosinophil infiltration into the distal colon was stained by Eosinophil Stain
32
33
34 Kit (ScyTek Laboratories, Inc., UT, USA). Simultaneously, acidic
35
36
37 polysaccharide was stained by Astra Blue (ScyTek Laboratories, Inc., UT,
38
39
40 USA).
41
42

43 44 45 46 Cell isolation and cytokine production

47
48
49 Mesenteric lymph nodes were isolated. Lymph node cells were isolated by
50
51
52 grinding the tissue and filtering the cell suspension through a 70-µm filter.
53
54
55 Then, CD4⁺ T-cells were enriched from lymph node cells by positive selection
56
57
58 with CD4 MicroBeads, according to the manufacturer's instructions (Miltenyi
59
60
61

1
2 Biotec, Bergisch Gladbach, Germany). Simultaneously, we collected and used
3
4 lymph node cells by negative selection with CD4 microbeads. CD4⁺ T-cells
5
6 from lymph node were stimulated with BioCoat anti-mouse CD3 T-cell
7
8 activation plates (BD, Franklin Lakes, NJ, USA), whereas lymph node cells by
9
10 negative selection with CD4 MicroBeads were cultured with normal plates.
11
12 After 48 h of culture, cytokine concentrations were determined in the culture
13
14 supernatants using enzyme-linked immunosorbent assays (ELISAs;
15
16 eBioscience, San Diego, CA, USA) and multiplex assays (Bio-Rad, Hercules,
17
18 CA, USA) according to the manufacturer's instructions.

development of oxazolone-induced colitis by analyzing body weight loss and

1
2 histology of the distal colon. IL-19-KO mice showed severe weight loss
3
4 compared with WT control mice from day 1 to day 2 (Fig. 1A). As shown in
5
6
7 Figure 1B, the administration of oxazolone to WT mice induced the expression
8
9 of *IL-19* mRNA in the distal colon 2 days after oxazolone administration.
10
11
12 Simultaneously, the administration of oxazolone to IL-19-KO mice induced no
13
14 expression of *IL-19* mRNA on day 2 (data now shown). Histological analysis
15
16 revealed that the distal colon in IL-19-KO mice exhibited increased numbers
17
18 of infiltrating cells and a general loss of tissue architecture 2 days after
19
20 oxazolone administration (Fig. 1C). The severity of colitis, as represented by
21
22 the histological score, was significantly increased in IL-19-KO mice compared
23
24 with WT mice (Fig. 1C).
25
26
27
28
29
30
31
32
33

34 In IL-19-KO mice, oxazolone treatment increased colonic MPO activity
35
36 (Fig. 2A), consistent with a marked increase in neutrophil infiltration as
37
38 evaluated using anti-Gr-1 antibodies (Fig. 2B). Interestingly, macrophage
39
40 infiltration (evaluated using anti-F4/80 antibodies) was also highly increased
41
42 in IL-19-KO mice with oxazolone-induced colitis (Fig. 2B).
43
44
45
46
47
48

49 IL-4 induces type-2 inflammatory responses, thereby stimulating
50
51 production of IL-13, B-cell-dependent production of serum IgE and
52
53 recruitment of eosinophils in mice with oxazolone-induced colitis (Hoving et
54
55 al., 2012). Therefore, we assessed serum IgE levels and blood eosinophil
56
57
58
59
60
61
62
63
64
65

1
2 levels in mice with oxazolone-induced colitis. Interestingly, circulating IgE
3
4
5 levels were significantly elevated in IL-19-KO mice in comparison with WT
6
7
8 mice (Fig. 2C). The number of circulating eosinophils was also significantly
9
10
11 elevated in IL-19-KO mice as compared with WT mice (Fig. 2D upper panel).

To estimate the eosinophil infiltration of IL-19-KO tissue preparations in the
distal colon, we used Eosinophil Stain Kit. Administration of oxazolone to
IL-19-KO mice showed marked eosinophil infiltrations as indicated red color
(Fig. 2D lower panels). However, WT showed little eosinophil infiltrations.

Collectively, these results showed that IL-19 deficiency exacerbated
oxazolone-induced colitis by facilitating the transport of inflammatory cells
into the colon.

Expression of inflammatory cytokines in the colons of mice with
oxazolone-induced colitis

To investigate the potential inflammatory mediators that may be altered by
IL-19 during oxazolone-induced colitis, we analyzed the expression of various
inflammatory mediators (i.e., *IL-1 β* , *IL-4*, *IL-6*, *TNF- α* , and *IL-10*) by
real-time PCR. Interestingly, administration of oxazolone to IL-19-KO mice
increased the expression of *IL-1 β* and *IL-4* mRNA in the distal colon (Fig. 3).

In contrast, IL-19-KO mice decreased the expression of *IL-10* mRNA.

1
2 However, the levels of *IL-6* and *TNF- α* were similar in WT and IL-19-KO
3
4 mice. These results suggested that IL-19 played an important role in the
5
6 **IL-4-mediated** inflammatory responses in mice with oxazolone-induced
7
8 colitis.
9
10

11
12
13
14
15
16 Altered cytokine production in lymph node cells from IL-19-KO mice with
17
18 oxazolone-induced colitis
19
20

21
22 Because the oxazolone-induced colitis model has been associated with
23
24 increases in Th2 responses (Heller et al., 2002; Boirivant et al., 1998), we
25
26 examined the levels of several types of cytokines in lymph node cells. As
27
28 shown in **Figure 4A**, CD4⁺ T-cells isolated from lymph node of IL-19-KO mice
29
30 with oxazolone-induced colitis produced elevated amounts of IL-2, IL-4, IL-9
31
32 and CCL5 upon stimulation with anti-CD3 and anti-CD28 antibodies *in vitro*.
33
34

35
36
37
38
39
40 **However, there are no marked changes in the amounts of IL-5, IL-13 (Fig. 4A)**
41
42 **and IL-17 (data not shown)**. These results suggested that IL-19 controlled Th2
43
44 cytokine IL-4. At the same time, we measured the production of several
45
46 cytokines in lymph node cells by negative selection with CD4⁺. As shown in
47
48 **Figure 4B**, IL-19-KO mice produced high levels of IL-12, G-CSF and CXCL1,
49
50 **but not TNF- α , IL-1 β and IL-6**, suggesting that the production of **these**
51
52 cytokines is controlled by IL-19.

Discussion

In this study, our experiments highlighted several novel aspects of the anti-inflammatory effects of IL-19 in Th2-mediated colitis *in vivo*. We found that the exacerbation of oxazolone-induced colitis by IL-19 deficiency was accompanied by increased production of IL-4 and IL-9 without increased production of IL-5 and IL-13. The oxazolone-induced colitis and UC include characteristic ulcers of the colon, which form through an IL-4-driven, Th2-mediated response to oxazolone (Heller et al., 2002; Boirivant et al., 1998). In addition, IL-4, IL-5, and IL-13 are upregulated in keratin 8-KO mice, which develop chronic spontaneous Th2-mediated colitis (Habtezion et al., 2005). IL-4 and IL-5 are correlated with the clinical and histological severity of colitis in UC patients (Inoue et al., 1999). IL-13 was found to be upregulated in UC patients and linked to an impaired epithelial barrier function in the gut (Heller et al., 2005). **Indeed, IL-5 and IL-13 as well as IL-4 have important roles in colonic inflammation. Why did IL-19-KO mice show increased production of IL-4, but not IL-5 and IL-13?** Although IL-4 and IL-13 are structurally analogous and share functional receptors, their function is quite different. IL-4 acts mainly as a regulatory cytokine and IL-13 acts as

1
2 an effector cytokine. IL-5 plays a key role in eosinophil proliferation,
3
4 differentiation, maturation, migration to tissue sites and survival
5
6 (Sitkauskiene et al., 2004). IL-4 was mainly produced by Th2, and Th2
7
8 produced IL-5 and IL-13. IL-5 and IL-13 were also produced by innate
9
10 lymphoid cells and invariant natural killer T cells. IL-4 and IL-5 promote the
11
12 clonal expansion and maturation of B cells and induces the IgM/IgE switch.
13
14 Released IgE activate mast cells to secrete IL-4, IL-5 and IL-13. In contrast, a
15
16 recent study reported that IL-9 plays an important role in driving UC by
17
18 regulating intestinal epithelial cells and that IL-9 represents a promising
19
20 target for the treatment of chronic colitis (Gerlach et al., 2014). Thus, it is
21
22 possible that IL-19 regulates IL-4 and IL-9 production, but not IL-5 and IL-13
23
24 production, because all of these cytokines are significant pathological factors
25
26 in oxazolone-induced colitis (Heller et al., 2002; Boirivant et al., 1998). In
27
28 line with these previous findings, our data suggest that IL-19 plays important
29
30 role in the gut by regulating Th2 cells to produce IL-4, but not innate
31
32 lymphoid cells and invariant natural killer T cells to produce IL-5 and IL-13.

40
41
42
43
44
45
46
47

48
49 It is not surprising to find that IL-2 was increased in IL-19-KO
50
51 compared to WT. IL-2 plays a critical role in the polarization of naive CD4 T
52
53 cells to the Th2 phenotype as well as Th1 clearly needs IL-2 (Cote-Sierra et
54
55 al., 2004). CCL5 is a chemotactic agent for T cells, eosinophils, and basophils
56
57
58
59
60
61
62
63
64
65

1
2 and plays an active role in recruiting leukocytes to sites of inflammation.
3
4
5 CCL5 does not play the survival for eosinophils although IL-3, IL-5 and
6
7
8 GM-CSF play the survival for eosinophils. We found that IL-19-KO showed
9
10
11 increased production of CCL5 though no alteration on the production of IL-3,
12
13
14 IL-5 and GM-CSF (Fig. 4A and data not shown), suggesting that IL-19 control
15
16
17 migration and infiltration to the tissue of eosinophils, but not proliferation
18
19
20 and survival for eosinophils.
21

22
23 IL-10 is a well-known anti-inflammatory and immunosuppressive
24
25
26 cytokine. Anti-inflammatory effect of IL-19 is reminiscent of the widely
27
28
29 accepted regulation of IL-10. There is the possibility that altered production
30
31
32 of cytokines in IL-19-KO was due to downregulation of IL-10.
33

34
35 Th17 is responsible for the IL-17 production, a key pro-inflammatory
36
37
38 cytokine that is increased in IBD (Zhu et al., 2015). There is the possibility
39
40
41 that altered production of cytokines in IL-19-KO was due to upregulation of
42
43
44 IL-17. However, both WT and IL-19-KO secreted equivalent amounts of IL-17
45
46
47 (data not shown), suggesting that IL-17 is not likely to mediate the
48
49
50 suppressive effect of IL-19.
51

52
53 Interestingly, we observed increased levels of IL-12, G-CSF and
54
55
56 CXCL1 in IL-19-KO mice with oxazolone-induced colitis. G-CSF
57
58
59 stimulates the survival, proliferation, differentiation, and functions of
60
61
62
63
64
65

1
2 neutrophil precursors and mature neutrophils and can induce the production of
3
4
5 granulocytes in the bone marrow. CXCL1 has neutrophil chemoattractant
6
7
8 activity and has been shown to function by signaling through the chemokine
9
10
11 receptor CXCR2, which is expressed on the surface of neutrophils. In a
12
13
14 previous study, researchers found that the colons of mice with
15
16
17 oxazolone-induced are flooded with inflammatory cells, including Gr-1⁺
18
19
20 neutrophils, $\gamma\delta$ T cells, eosinophils, NKT cells, and CD4⁺ T-cells (Camelo et
21
22
23 al., 2012). Consistent with previous result, we found here that IL-19-KO mice
24
25
26 exhibited increased Gr-1⁺ neutrophils and eosinophils, supporting the role of
27
28
29 IL-19 in mediating intestinal inflammation. IL-12 is a well-known Th1
30
31
32 cytokine. In addition, IL-12 mediates enhancement of the cytotoxic activity of
33
34
35 NK cells and CD8⁺ cytotoxic T-cells. Thus, it is possible that IL-19 may
36
37
38 regulate NK cells and CD8⁺ cytotoxic T-cells in oxazolone-induced colitis.
39

40
41 It is well known that pro-inflammatory cytokines play an important role
42
43
44 in inflammation of the intestinal mucosa. For instance, IL-6, IL-1 β , and
45
46
47 TNF- α have been shown to play pivotal roles in the pathogenesis of IBD
48
49
50 (Fiocchi, 1998; Bouma and Strober, 2003). Both IL-6-deficient mice and
51
52
53 caspase-1 (IL-1 β converting enzyme)-deficient mice have been shown to have
54
55
56 less severe colitis induced by DSS, suggesting that IL-6 and IL-1 β both play a
57
58
59 role in promoting T-cell-independent acute colitis (Siegmund et al., 2001;
60
61
62

1
2 Naito et al., 2004). In contrast, TNF- α -deficient mice have been shown to be
3
4 more susceptible to DSS-induced colitis (Naito et al., 2003), whereas a low
5
6 dose TNF- α monoclonal antibody treatment protected against chronic colitis
7
8 (Kojouharoff et al., 1997). In our study, lymph node cells showed a similar
9
10 production of IL-6, IL-1 β and TNF- α between WT and IL-19-KO.
11
12 Interestingly, we also found that real-time RT-PCR analysis of the distal
13
14 colons of mice showed increased expression of IL-1 β , but not IL-6 and
15
16 TNF- α , in IL-19-KO compared to WT. It is likely that non-immune cells in the
17
18 gut tissue produced IL-1 β in IL-19-KO with oxazolone-induced colitis. These
19
20 results indicate that IL-19 may play as anti-inflammatory effector by acting
21
22 both immune cell and non-immune cell, regardless of the mechanism.
23
24
25
26
27
28
29
30
31
32
33

34 In a previous study, we showed that DSS-induced colitis is exacerbated
35
36 in IL-19-KO mice (Azuma et al., 2010a). The increased severity of colonic
37
38 inflammation following genetic ablation of IL-19 was accompanied by
39
40 increased production of many inflammatory cytokines, including IFN- γ ,
41
42 IL-1 β , IL-6, IL-12, TNF- α , and CXCL1, several of which have been implicated
43
44 in the pathogenesis of DSS-induced colitis. In contrast, CD4⁺ T-cells have
45
46 been shown to play a central role in IBD. We showed that IL-19 deficiency
47
48 aggravated TNBS-induced colitis. Additionally, the exacerbation of
49
50 TNBS-induced colonic inflammation following genetic ablation of IL-19 was
51
52
53
54
55
56
57
58
59
60
61
62
63
64
65

1
2 accompanied by increased production of IFN- γ , IL-12, IL-17, IL-22 and IL-33
3
4 (Matsuo et al., 2015). IL-19 can have anti-inflammatory roles in the gut,
5
6
7 regardless the type of colonic inflammation. In type-1 responses, such as in
8
9
10 DSS and TNBS-induced colitis, we revealed that IL-19 clearly plays
11
12 anti-inflammatory role. In type-2 responses, our present study provides solid
13
14 evidence for the immunopathological relevance of IL-19 as an
15
16 anti-inflammatory cytokine in colonic inflammation. Consistent with our data,
17
18
19 recent studies have reported that IL-19 is impaired in patients with active UC
20
21
22 (Fonseca-Camarillo et al., 2014). Our data add a new key player as colonic
23
24
25 inflammation, showing that IL-19 act as potent anti-inflammatory cytokine.
